# **Appendix D: Java Programming Cheatsheet**

This appendix summarizes the most commonly-used Java language features in the textbook. Here are the <u>APIs</u> of the most common libraries.

## Hello, World.

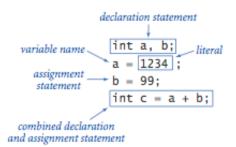

## Editing, compiling, and executing.

## Built-in data types.

type	set of values	common operators	sample literal values
int	integers	+ - * / %	99 -12 2147483647
double	floating-point numbers	+ - * /	3.14 -2.5 6.022e23
boolean	boolean values	&&    !	true false
char	characters		'A' '1' '%' '\n'
String	sequences of characters	+	"AB" Hello" "2.5"

## Declaration and assignment statements.

## Integers.

values					
typical literals		1234	99 -99 0	1000000	
operations	add	subtract	multiply	divide	remainder
operators	+	-	*	/	%

expression	value	comment
5 + 3	8	
5 - 3	2	
5 * 3	15	
5 / 3	1	no fractional part
5 % 3	2	remainder
1 / 0		run-time error
3 * 5 - 2	13	* has precedence
3 + 5 / 2	5	/ has precedence
3 - 5 - 2	-4	left associative
(3-5)-2	-4	better style
3 - (5 - 2)	0	unambiguous

## Floating-point numbers.

values	real numbers (specified by IEEE 754 standard)				
typical literals	3.14159	6.022e23	-3.0	2.0	1.4142135623730951
operations	add	subtract	n	nultiply	divide
operators	+	-		*	/

expression	value
3.141 + .03	3.171
3.14103	3.111
6.02e23 / 2.0	3.01e23
5.0 / 3.0	1.66666666666666
10.0 % 3.141	0.577
1.0 / 0.0	Infinity
Math.sqrt(2.0)	1.4142135623730951
Math.sqrt(-1.0)	NaN

## **Booleans.**

values	true or false			
literals	tr	ue fa	lse	
operations	and	or	not	
operators	8.8	П	1	

a	!a	a	b	a && b	a    b
true	false	false	false	false	false
false	true	false	true	false	true
		true	false	false	true
		true	true	true	true

## Comparison operators.

op	meaning	true	false
	equal	2 == 2	2 == 3
!=	not equal	3 != 2	2 != 2
<	less than	2 < 13	2 < 2
<=	less than or equal	2 <= 2	3 <= 2
>	greater than	13 > 2	2 > 13
>=	greater than or equal	3 >= 2	2 >= 3

non-negative discriminant? (b\*b - 4.0\*a\*c) >= 0.0 beginning of a century? (year % 100) == 0 legal month? (month >= 1) && (month <= 12)

## Parsing command-line arguments.

int Integer.parseInt(String s) convert s to an int value
double Double.parseDouble(String s) convert s to a double value
long Long.parseLong(String s) convert s to a long value

## Math library.

```
public class Math
  double abs(double a)
                                          absolute value of a
  double max(double a, double b) maximum of a and b
  double min(double a, double b) minimum of a and b
Note 1: abs(), max(), and min() are defined also for int, long, and float.
  double sin(double theta)
                                          sine function
  double cos(double theta)
                                          cosine function
  double tan(double theta)
                                          tangent function
Note 2: Angles are expressed in radians. Use toDegrees() and toRadians() to convert.
Note 3: Use asin(), acos(), and atan() for inverse functions.
  double exp(double a)
                                          exponential (ea)
  double log(double a)
                                          natural log (log, a, or ln a)
  double pow(double a, double b) raise a to the bth power (ab)
     long round(double a)
                                          round to the nearest integer
  double random()
                                          random number in [0, 1)
  double sqrt(double a)
                                          square root of a
  double E
                                          value of e (constant)
  double PI
                                          value of π (constant)
```

expression	library	type	value
<pre>Integer.parseInt("123")</pre>	Integer	int	123
Math.sqrt(5.0*5.0 - 4.0*4.0)	Math	double	3.0
Math.random()	Math	double	random in [0, 1)
Math.round(3.14159)	Math	long	3

The full <u>java.lang.Math API</u>.

## Type conversion.

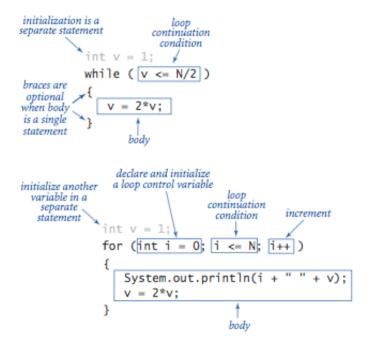

expression	expression type	expression value
"1234" + 99	String	"123499"
<pre>Integer.parseInt("123")</pre>	int	123
(int) 2.71828	int	2
Math.round(2.71828)	long	3
(int) Math.round(2.71828)	int	3
(int) Math.round(3.14159)	int	3
11 * 0.3	double	3.3
(int) 11 * 0.3	double	3.3
11 * (int) 0.3	int	0
(int) (11 * 0.3)	int	3

### If and if-else statements.

```
absolute value
              if (x < 0) x = -x;
                 (x > y)
              {
put x and y
                  int t = x;
    into
                 y = x;
sorted order
                  x = t;
maximum of
              if (x > y) max = x;
                          max = y;
  x and y
 error check
              if (den == 0) System.out.println("Division by zero");
 for division
                              System.out.println("Quotient = " + num/den);
              else
 operation
              double discriminant = b*b - 4.0*c;
              if (discriminant < 0.0)
                  System.out.println("No real roots");
 error check
              }
for quadratic
              else
  formula
              {
                  System.out.println((-b + Math.sqrt(discriminant))/2.0);
                  System.out.println((-b - Math.sqrt(discriminant))/2.0);
              }
```

### Nested if-else statement.

## While and for loops.

print largest power of two less than or equal to N	<pre>int v = 1; while (v &lt;= N/2)     v = 2*v; System.out.println(v);</pre>
compute a finite sum $(1+2+\ldots+N)$	<pre>int sum = 0; for (int i = 1; i &lt;= N; i++)     sum += i; System.out.println(sum);</pre>
compute a finite product $(N! = 1 \times 2 \times \times N)$	<pre>int product = 1; for (int i = 1; i &lt;= N; i++)    product *= i; System.out.println(product);</pre>
print a table of function values	<pre>for (int i = 0; i &lt;= N; i++)    System.out.println(i + " " + 2*Math.PI*i/N);</pre>
print the ruler function (see Program 1.2.1)	<pre>String ruler = " "; for (int i = 1; i &lt;= N; i++)   ruler = ruler + i + ruler; System.out.println(ruler);</pre>

### Break statement.

```
int i;
for (i = 2; i <= N/i; i++)
   if (N % i == 0) break;
if (i > N/i) System.out.println(N + " is prime");
```

## Do-while loop.

```
do {
    x = 2.0*Math.random() - 1.0;
    y = 2.0*Math.random() - 1.0;
} while (Math.sqrt(x*x + y*y) > 1.0);
```

### Switch statement.

```
switch (day)
{
   case 0: System.out.println("Sun"); break;
   case 1: System.out.println("Mon"); break;
   case 2: System.out.println("Tue"); break;
   case 3: System.out.println("Wed"); break;
   case 4: System.out.println("Thu"); break;
   case 5: System.out.println("Fri"); break;
   case 6: System.out.println("Sat"); break;
}
```

### Arrays.

Compile-time initialization.

```
String[] suit = { "Clubs", "Diamonds", "Hearts", "Spades" };

String[] rank =
{
    "2", "3", "4", "5", "6", "7", "8", "9", "10",
    "Jack", "Queen", "King", "Ace"
};
```

Typical array-processing code.

```
double[] a = new double[N];
   create an array
                      for (int i = 0; i < N; i++)
 with random values
                         a[i] = Math.random();
print the array values,
                      for (int i = 0; i < N; i++)
    one per line
                         System.out.println(a[i]);
                      double max = Double.NEGATIVE_INFINITY;
find the maximum of
                      for (int i = 0; i < N; i++)
  the array values
                         if (a[i] > max) max = a[i];
                      double sum = 0.0;
compute the average of
                      for (int i = 0; i < N; i++)
                         sum += a[i];
   the array values
                      double average = sum / N;
                      double[] b = new double[N];
                      for (int i = 0; i < N; i++)
copy to another array
                         b[i] = a[i];
                      for (int i = 0; i < N/2; i++)
 reverse the elements
                         double temp = b[i];
  within an array
                         b[i] = b[N-1-i];
                         b[N-i-1] = temp;
                     }
```

## Two-dimensional arrays.

```
a[1][2]
            85
       99
               98
row 1→ 98
                78
            57
       92
                76
            77
       94
           32
                11
                22
       99
           34
       90
           46
                54
                88
       76
           59
       92
           66
                89
       97
           71
                24
       89
           29
                38
              column 2
```

### Compile-time initialization.

```
int[][] a =
{
     { 99, 85, 98, 0 },
     { 98, 57, 78, 0 },
     { 92, 77, 76, 0 },
     { 94, 32, 11, 0 },
     { 99, 34, 22, 0 },
     { 90, 46, 54, 0 },
     { 76, 59, 88, 0 },
     { 92, 66, 89, 0 },
     { 97, 71, 24, 0 },
     { 89, 29, 38, 0 },
     { 0, 0, 0, 0 }
};
```

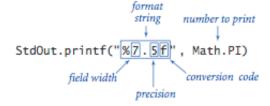

### Ragged arrays.

```
for (int i = 0; i < a.length; i++)
{
   for (int j = 0; j < a[i].length; j++)
       System.out.print(a[i][j] + " ");
   System.out.println();
}</pre>
```

## Our standard output library.

API for our library of static methods for standard output

The full **StdOut API**.

### Anatomy of a formatted print statement

type	code	typical literal	sample format strings	converted string values for output
int	d	512	"%14d" "%-14d"	"512"
double	f e	1595.1680010754388	"%14.2f" "%.7f" "%14.4e"	" 1595.17" "1595.1680011" " 1.5952e+03"
String	s	"Hello, World"	"%14s" "%-14s" "%-14.5s"	" Hello, World" "Hello, World " "Hello "

## Our standard input library.

pub1	lic	c l	lass	StdIn
		_		

b	oolean	isEmpty()	true if no more values, false otherwise
	int	readInt()	read a value of type int
	double	readDouble()	read a value of type double
	long	readLong()	read a value of type long
b	oolean	readBoolean()	read a value of type boolean
	char	readChar()	read a value of type char
	String	readString()	read a value of type String
	String	readLine()	read the rest of the line
	String	readAll()	read the rest of the text

API for our library of static methods for standard input

The full **StdIn API**.

## Our standard drawing library.

#### public class StdDraw

```
void line(double x0, double y0, double x1, double y1)
void point(double x, double y)
void text(double x, double y, String s)
void circle(double x, double y, double r)
void filledCircle(double x, double y, double r)
void square(double x, double y, double r)
void filledSquare(double x, double y, double r)
void polygon(double[] x, double[] y)
void filledPolygon(double[] x, double[] y)
void setXscale(double x0, double x1)
                                             reset x range to (x_0, x_1)
void setYscale(double y0, double y1)
                                             reset y range to (y_0, y_1)
void setPenRadius(double r)
                                             set pen radius to r
void setPenColor(Color c)
                                             set pen color to C
void setFont(Font f)
                                             set text font to f
void setCanvasSize(int w, int h)
                                             set canvas to w-by-h window
void clear(Color c)
                                             clear the canvas; color it C
void show(int dt)
                                             show all; pause dt milliseconds
void save(String filename)
                                             save to a .jpg or w.png file
```

Note: Methods with the same names but no arguments reset to default values.

API for our library of static methods for standard drawing

The full StdDraw API.

## Our standard audio library.

```
void play(String file)

void play(Guble[] a)

void play(double[] a)

void play(double x)

void play(double x)

void save(String file, double[] a)

double[] read(String file)

play the given sound wave

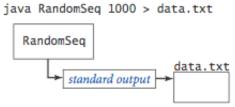

play sample for 1/44100 second

read from a .wav file
```

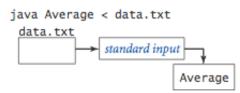

API for our library of static methods for standard audio

The full StdAudio API.

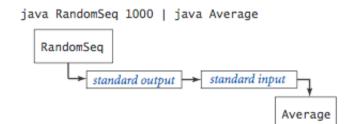

### Redirection and piping.

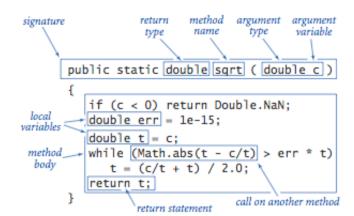

Redirecting from a file to standard input

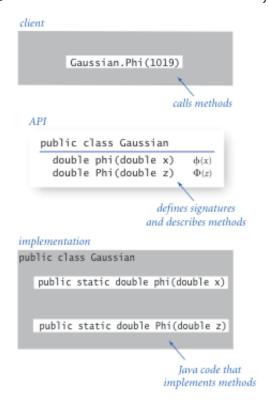

Piping the output of one program to the input of another

## **Functions.**

```
public static int abs(int x)
absolute value of an
                       if (x < 0) return -x;
    int value
                                   return x;
                   }
                   public static double abs(double x)
absolute value of a
                       if (x < 0.0) return -x;
  double value
                                     return x;
                      else
                   }
                   public static boolean isPrime(int N)
                       if (N < 2) return false;
                       for (int i = 2; i <= N/i; i++)
  primality test
                          if (N % i == 0) return false;
                       return true;
                   }
  hypotenuse of
                   public static double hypotenuse(double a, double b)
                   { return Math.sqrt(a*a + b*b); }
 a right triangle
                   public static double H(int N)
                       double sum = 0.0;
                      for (int i = 1; i <= N; i++)
sum += 1.0 / i;
Harmonic number
                       return sum;
                   }
                   public static int uniform(int N)
 uniform random
 integer in [0, N)
                   { return (int) (Math.random() * N); }
                   public static void drawTriangle(double x0, double y0,
                                                       double x1, double y1,
double x2, double y2)
 draw a triangle
                      StdDraw.line(x0, y0, x1, y1);
                       StdDraw.line(x1, y1, x2, y2);
                       StdDraw.line(x2, y2, x0, y0);
                   }
```

## Libraries of functions.

## Our standard random library.

public class StdRandom

int discrete(double[] a)

void shuffle(double[] a)

```
int uniform(int N)

double uniform(double lo, double hi)

boolean bernoulli(double p)

double gaussian()

double gaussian(double m, double s)

integer between 0 and N-1

real between lo and hi

true with probability p

normal, mean 0, standard deviation 1
```

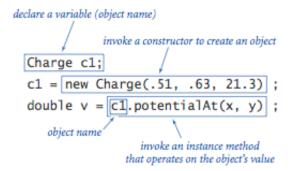

i with probability a[i]

randomly shuffle the array a[]

## Our standard statistics library.

```
public class StdStats
  double max(double[] a)
                                         largest value
  double min(double[] a)
                                         smallest value
  double mean(double[] a)
                                         average
  double var(double[] a)
                                         sample variance
  double stddev(double[] a)
                                         sample standard deviation
  double median(double[] a)
                                         median
    void plotPoints(double[] a)
                                         plot points at (i, a[i])
    void plotLines(double[] a)
                                         plot lines connecting points at (i, a[i])
    void plotBars(double[] a)
                                         plot bars to points at (i, a[i])
```

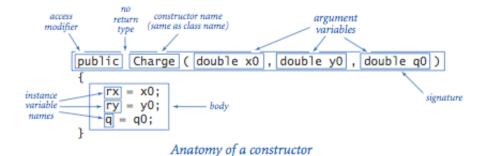

## Using an object.

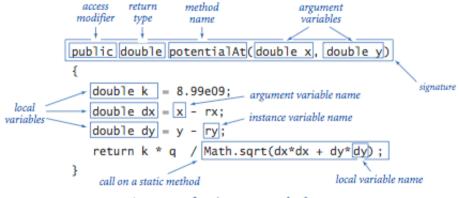

## Creating an object.

Instance variables.

#### Constructors.

Instance methods.

Anatomy of an instance method

### Classes.

## Java's String data type.

public class String (Java string data type)

```
String(String s)
                                                   create a string with the same value as 5
      int length()
                                                   string length
     char charAt(int i)
                                                   ith character
  String substring(int i, int j)
                                                   ith through (j-1)st characters
 boolean contains(String sub)
                                                   does string contain sub as a substring?
 boolean startsWith(String pre)
                                                   does string start with pre?
 boolean endsWith(String post)
                                                   does string end with post?
      int indexOf(String p)
                                                   index of first occurrence of p
      int indexOf(String p, int i)
                                                   index of first occurrence of p after i
  String concat(String t)
                                                   this string with t appended
      int compareTo(String t)
                                                   string comparison
  String replaceAll(String a, String b)
                                                   result of changing as to bs
String[] split(String delim)
                                                   strings between occurrences of delim
 boolean equals(String t)
                                                   is this string's value the same as t's?
```

The full <u>iava.lang.String API</u>.

```
String a = "now is ";
  String b = "the time";
String c = "to"
                 call
                        value
                        7
          a.length()
        a.charAt(4)
                        "w i"
  a.substring(2, 5)
b.startsWith("the")
                        true
    a.indexOf("is")
        a.concat(c)
                        "now is to"
 b.replace('t','T')
                        "The Time "
    a.split(" ")[0]
                        "now"
    a.split(" ")[1]
                        "is"
                        false
        b.equals(c)
```

*Note*: the <u>java.lang.StringBuilder</u> API is similar, but StringBuilder supports some operations more efficiently than String (notably, string concatenation) and some operations less efficiently (notably, substring extraction).

### Java's Color data type.

```
public class java.awt.Color
                 Color(int r, int g, int b)
            int getRed()
                                         red intensity
            int getGreen()
                                         green intensity
            int getBlue()
                                         blue intensity
         Color brighter()
                                         brighter version of this color
         Color darker()
                                         darker version of this color
        String toString()
                                         string representation of this color
       boolean equals(Color c)
                                         is this color's value the same as C's?
```

The full <u>java.awt.Color API</u>.

## Our input library.

```
In()

In()

In(String name)

create an input stream from standard input
create an input stream from a file or website
true if no more input, false otherwise
int readInt()

double readDouble()

read a value of type int
read a value of type double
```

Note: All operations supported by StdIn are also supported for In objects.

The full In API.

## Our output library.

#### public class Out

```
Out()

Out(String name)

void print(String s)

void println(String s)

void println(String s)

void println(String s)

void println(String s)

void println()

print s and a newline to the output stream

void println()

print a newline to the output stream

void printf(String f, ...)

formatted print to the output steam
```

The full Out API.

## Our picture library.

#### public class Picture

```
create a picture from a file
        Picture(String filename)
        Picture(int w, int h)
                                                   create a blank w-by-h picture
  int width()
                                                   return the width of the picture
  int height()
                                                   return the height of the picture
Color get(int x, int y)
                                                   return the color of pixel (x, y)
 void set(int x, int y, Color c)
                                                   set the color of pixel (x, y) to C
 void show()
                                                   display the image in a window
 void save(String filename)
                                                   save the image to a file
```

The full Picture API.

## Compile-time and run-time errors.

Here's a <u>list of errors</u> compiled by Mordechai Ben-Ari. It includes a list of common error message and typical mistakes that give rise to them.
